

I have been a truck driver for the last 18 years. Satellite radio is the best thing I've ever put in a truck. I've often used XM's traffic channels to determine whether or not to seek a bypass route well before I get to a city. It keeps congestion from delaying me and keeps me from adding to the congestion that's already there.

Why would I want to search through local stations, who's signals I can't even keep for very long, and listen to music, etc. that I don't even want to in order to hear their occasional traffic reports? I can listen to what I want to and get the traffic where/when I want to.

Other than for the purposes of protectionism, what could be wrong with this?
